# MCP2551

High Speed CAN Transceiver

Features

- Supports 1 Mb/s operation
- Implements ISO 11898 standard physical layer requirements
- Suitable for 12 V and 24 V systems
- Externally controlled slope for reduced RFI emissions
- Detection of ground fault (permanent dominant) on TXD input
- Power-on reset and voltage brown-out protection
- An unpowered node or brown-out event will not disturb the CAN bus
- Low current standby operation
- Protection against damage due to short circuit conditions (positive or negative battery voltage)
- Protection against high voltage transients
- Automatic thermal shutdown protection
- Up to 112 nodes can be connected
- High noise immunity due to differential bus implementation
- Temperature ranges:
  - Industrial (I):   -40°C to +85°C
  - Extended (E):   -40°C to +125°C

NOTES:

Preliminary

1.0 DEVICE OVERVIEW

The MCP2551 is a high speed CAN fault tolerant device that serves as the interface between a CAN protocol controller and the physical bus. The MCP2551 provides differential transmit and receive capability for the CAN protocol controller and is fully compatible with the ISO 11898 standard, including 24 V requirements. It will operate at speeds of up to 1 Mb/s.

Typically, each node in a CAN system must have a device to convert the digital signals generated by a CAN controller to signals suitable for transmission over the bus cabling (differential output). It also provides a buffer between the CAN controller and the high voltage spikes that can be generated on the CAN bus by outside sources (EMI, ESD, electrical transients, etc.).

1.1 Transmitter Function

The CAN bus has two states: Dominant and Recessive. A dominant state occurs when the differential voltage between CANH and CANL is greater than a defined voltage (e.g.,1.2 V). A recessive state occurs when the differential voltage is less than a defined voltage (typically 0 V). The dominant and recessive states correspond to the low and high state of the TXD input pin, respectively. However, a dominant state initiated by another CAN node will override a recessive state on the CAN bus.

1.1.1 MAXIMUM NUMBER OF NODES

The MCP2551 CAN outputs will drive a minimum load of 45 Ω, allowing a maximum of 112 nodes to be connected (given a minimum differential input resistance of 20 kΩ and a nominal termination resistor value of 120 Ω).

1.2 Receiver Function

The RXD output pin reflects the differential bus voltage between CANH and CANL. The low and high states of the RXD output pin correspond to the Dominant and Recessive states of the CAN bus, respectively.

1.3 Internal Protection

CANH and CANL are protected against battery short circuits and electrical transients that can occur on the CAN bus. This feature prevents destruction of the transmitter output stage during such a fault condition.

The device is further protected from excessive current loading by thermal shutdown circuitry that disables the output drivers when the junction temperature exceeds a nominal limit of 165°C. All other parts of the chip remain operational and the chip temperature is lowered due to the decreased power dissipation in the transmitter outputs. This protection is essential to protect against bus line short-circuit induced damage.

1.4 Operating Modes

The Rs pin allows three modes of operation to be selected:

• High Speed
• Slope Control
• Standby

These modes are summarized in Table 1-1.

When in high speed or slope control mode, the drivers for the CANH and CANL signals are internally regulated to provide controlled symmetry in order to minimize EMI emissions.

In addition, the slope of the signal transitions on CANH and CANL can be controlled with a resistor connected from pin 8 (Rs) to ground, with the slope proportional to the current output at Rs, further reducing EMI emissions.

1.4.1 HIGH SPEED

The high speed mode is selected by connecting the Rs pin to Vss. In this mode, the transmitter output drivers have fast output rise and fall times to support high-speed CAN bus rates.

1.4.2 SLOPE CONTROL

Slope control mode further reduces EMI by limiting the rise and fall times of CANH and CANL. The slope, or slew rate (SR), is controlled by connecting an external resistor (R_{EXT}) between Rs and V_{OL} (usually ground). The slope is proportional to the current output at the Rs pin. Since the current is primarily determined by the slope-control resistance value R_{EXT}, a certain slew rate is achieved by applying a respective resistance. Figure 1-1 illustrates typical slew rate values as a function of the slope-control resistance value.

1.4.3 STANDBY MODE

The device may be placed in standby or "sleep" mode by applying a high level to Rs. In sleep mode, the transmitter is switched off and the receiver operates at a lower current. The receive pin on the controller side (RXD) is still functional but will operate at a slower rate. The attached microcontroller can monitor RXD for CAN bus activity and place the transceiver into normal operation via the Rs pin (at higher bus rates the first CAN message may be lost).
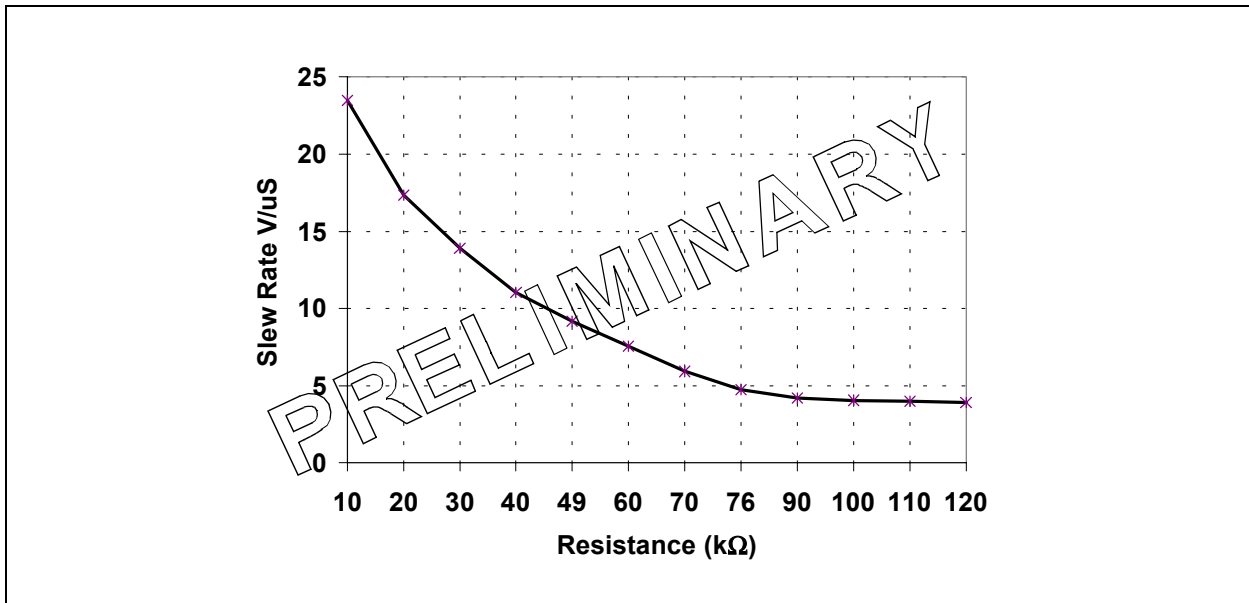

MCP2551

TABLE 1-1: MODES OF OPERATION

Mode	Current at R_S Pin	Resulting Voltage at R_S Pin
Standby	$-I_{RS} < 10 \mu A$	$V_{RS} > 0.75V_{DD}$
Slope Control	$10 \mu A < -I_{RS} < 200 \mu A$	$0.4V_{DD} < V_{RS} < 0.6V_{DD}$
High Speed	$-I_{RS} < 610 \mu A$	$0 < V_{RS} < 0.3V_{DD}$

TABLE 1-2: TRANSCEIVER TRUTH TABLE

V_{DD}	V_{RS}	TXD	CANH	CANL	Bus State[1]	RXD[1]
$4.5\ V \leq V_{DD} \leq 5.5\ V$	$V_{RS} < 0.75V_{DD}$	0	HIGH	LOW	Dominant	0
		1 or floating	Not Driven	Not Driven	Recessive	1
	$V_{RS} > 0.75V_{DD}$	X	Not Driven	Not Driven	Recessive	1
$V_{POR} < V_{DD} < 4.5\ V$ (See **Note 3**)	$V_{RS} < 0.75V_{DD}$	0	HIGH	LOW	Dominant	0
		1 or floating	Not Driven	Not Driven	Recessive	1
	$V_{RS} > 0.75V_{DD}$	X	Not Driven	Not Driven	Recessive	1
$0 < V_{DD} < V_{POR}$	X	X	Not Driven/ No Load	Not Driven/ No Load	High Impedance	X

Note 1: If another bus node is transmitting a dominant bit on the CAN bus, then RXD is a logic 0.

2: X = "don't care".

3: Device drivers will function, although outputs are not guaranteed to meet ISO-11898 specification.

1.5 TXD Permanent Dominant Detection

If the MCP2551 detects an extended low state on the TXD input, it will disable the CANH and CANL output drivers in order to prevent the corruption of data on the CAN bus. The drivers are disabled if TXD is low for more than 1.25 ms (minimum). This implies a maximum bit time of 62.5 μs or minimum bus rate of 16 kb/s (allowing a maximum 20 consecutive transmitted dominant bits during a multiple bit error and error frame scenario). The drivers remain disabled as long as TXD remains low. A rising edge on TXD will reset the timer logic and enable the CANH and CANL output drivers.

1.6 Power-on Reset

When the device is powered on, CANH and CANL remain in a high impedance state until V_{DD} reaches the voltage level V_{PORH}. In addition, CANH and CANL will remain in a high impedance state if TXD is low when V_{DD} reaches V_{PORH}. CANH and CANL will become active only after TXD is asserted high. Once powered on, CANH and CANL will enter a high impedance state if the voltage level at V_{DD} falls below V_{PORL}, providing voltage brown-out protection during normal operation.

1.7 Pin Descriptions

The 8-pin pinout is listed in Table 1-3.

TABLE 1-3: MCP2551 PINOUT

Pin Number	Pin Name	Pin Function
1	TXD	Transmit Data Input
2	V_{SS}	Ground
3	V_{DD}	Supply Voltage
4	RXD	Receive Data Output
5	V_{REF}	Reference Output Voltage
6	CANL	CAN Low Level Voltage I/O
7	CANH	CAN High Level Voltage I/O
8	R_S	Slope Control Input

1.7.1 TRANSMITTER DATA INPUT (TXD)

TXD is a TTL compatible input pin. The data on this pin is driven out on the CANH and CANL differential output pins. It is usually connected to the transmitter data output of the CAN controller device. When TXD is low, CANH and CANL are in the dominant state. When TXD is high, CANH and CANL are in the recessive state (provided that another CAN node is not driving the CAN bus with a dominant state). TXD has an internal pull-up resistor (nominal 25 kΩ to V_{DD}.)

1.7.2 GROUND SUPPLY (V_{SS})

Ground supply pin.

1.7.3 SUPPLY VOLTAGE (V_{DD})

Positive supply voltage pin.

1.7.4 RECEIVER DATA OUTPUT (RXD)

RXD is a TTL compatible output that drives high or low depending upon the differential signals on the CANH and CANL pins and is usually connected to the receiver data input of the CAN controller device. RXD is high when the CAN bus is recessive and low in the dominant state.

1.7.5 REFERENCE VOLTAGE (V_{REF})

Reference Voltage Output. (Defined as $V_{DD}/2$).

1.7.6 CAN LOW (CANL)

The CANL output drives the low side of the CAN differential bus. This pin is also tied internally to the receive input comparator.

1.7.7 CAN HIGH (CANH)

The CANH output drives the high side of the CAN differential bus. This pin is also tied internally to the receive input comparator.

1.7.8 SLOPE RESISTOR INPUT (R_S)

The R_S pin is used to select High Speed, Slope Control, or Standby modes via an external biasing resistor.

MCP2551

2.0 ELECTRICAL CHARACTERISTICS

2.1 Terms and Definitions

A number of terms are defined in ISO 11898 that are used to describe the electrical characteristics of a CAN transceiver device. These terms and definitions are summarized in this section.

2.1.1 BUS VOLTAGE

V_{CANL} and V_{CANH}, denoting the voltages of the bus line wires, CANL and CANH, relative to ground of each individual CAN node.

2.1.2 COMMON MODE BUS VOLTAGE RANGE

Boundary voltage levels of V_{CANL} and V_{CANH} with respect to ground, for which proper operation will occur, if up to the maximum number of CAN nodes are connected to the bus.

2.1.3 DIFFERENTIAL INTERNAL CAPACITANCE, C_{DIFF} (OF A CAN NODE)

Capacitance seen between CANL and CANH during the recessive state when the CAN node is disconnected from the bus (see Figure 2-1).

2.1.4 DIFFERENTIAL INTERNAL RESISTANCE, R_{DIFF} (OF A CAN NODE)

Resistance seen between CANL and CANH during the recessive state when the CAN node is disconnected from the bus (see Figure 2-1).

2.1.5 DIFFERENTIAL VOLTAGE, V_{DIFF} (OF CAN BUS)

Differential voltage of the two-wire CAN bus, value $V_{DIFF} = V_{CANH} - V_{CANL}$.

2.1.6 INTERNAL CAPACITANCE, C_{IN} (OF A CAN NODE)

Capacitance seen between CANL (or CANH) and ground during the recessive state when the CAN node is disconnected from the bus (see Figure 2-1).

2.1.7 INTERNAL RESISTANCE, R_{IN} (OF A CAN NODE)

Resistance which is seen between CANL (or CANH) and ground during the recessive state when the CAN node is disconnected from the bus (see Figure 2-1).

§ Significant Characteristic

Notes:
Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed
.010" (0.254mm) per side.
JEDEC Equivalent: MS-012
Drawing No. C04-057

NOTES:

ON-LINE SUPPORT

Microchip provides on-line support on the Microchip World Wide Web (WWW) site.

The web site is used by Microchip as a means to make files and information easily available to customers. To view the site, the user must have access to the Internet and a web browser, such as Netscape or Microsoft Explorer. Files are also available for FTP download from our FTP site.

Connecting to the Microchip Internet Web Site

The Microchip web site is available by using your favorite Internet browser to attach to:

www.microchip.com

The file transfer site is available by using an FTP service to connect to:

ftp://ftp.microchip.com

The web site and file transfer site provide a variety of services. Users may download files for the latest Development Tools, Data Sheets, Application Notes, User's Guides, Articles and Sample Programs. A variety of Microchip specific business information is also available, including listings of Microchip sales offices, distributors and factory representatives. Other data available for consideration is:

- Latest Microchip Press Releases
- Technical Support Section with Frequently Asked Questions
- Design Tips
- Device Errata
- Job Postings
- Microchip Consultant Program Member Listing
- Links to other useful web sites related to Microchip Products
- Conferences for products, Development Systems, technical information and more
- Listing of seminars and events

Systems Information and Upgrade Hot Line

The Systems Information and Upgrade Line provides system users a listing of the latest versions of all of Microchip's development systems software products. Plus, this line provides information on how customers can receive any currently available upgrade kits.The Hot Line Numbers are:

1-800-755-2345 for U.S. and most of Canada, and

1-480-792-7302 for the rest of the world.

013001

MCP2551

READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this Data Sheet.

To: Technical Publications Manager   Total Pages Sent _____

RE: Reader Response

From: Name _____

        Company _____

        Address _____

        City / State / ZIP / Country _____

        Telephone: (_____) _____ - _____   FAX: (_____) _____ - _____

Application (optional): _____

Would you like a reply? ____Y ____N

Device: **MCP2551**   Literature Number: **DS21667B**

Questions:

1. What are the best features of this document?

   _____

   _____

2. How does this document meet your hardware and software development needs?

   _____

   _____

3. Do you find the organization of this data sheet easy to follow? If not, why?

   _____

   _____

4. What additions to the data sheet do you think would enhance the structure and subject?

   _____

   _____

5. What deletions from the data sheet could be made without affecting the overall usefulness?

   _____

   _____

6. Is there any incorrect or misleading information (what and where)?

   _____

   _____

7. How would you improve this document?

   _____

   _____

8. How would you improve our software, systems, and silicon products?

   _____

   _____

Preliminary

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO.	X	/XX
Device	**Temperature Range**	**Package**

Device:	MCP2551 = High Speed CAN Transceiver
Temperature Range:	I = -40°C to +85°C E = -40°C to +125°C
Package:	P = Plastic DIP (300 mil Body) 8-lead SN = Plastic SOIC (150 mil Body) 8-lead

Examples:

a) MCP2551-I/P: Industrial temperature, PDIP package.

b) MCP2551-E/P: Extended temperature, PDIP package.

c) MCP2551-I/SN: Industrial temperature, SOIC package.

d) MCP2551T-I/SN: Tape and Reel, Industrial Temperature, SOIC package.

e) MCP2551T-E/SN: Tape and Reel, Extended Temperature, SOIC package.

Sales and Support

Data Sheets

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
3. The Microchip Worldwide Site (www.microchip.com)

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

New Customer Notification System

Register on our web site (www.microchip.com/cn) to receive the most current information on our products.
